

Introduction to Command Line

UBCO Master of Data Science – DATA 541

Introduction

Instructor: Dr. Mohammad Khalad Hasan

- Assistant Professor, Computer Science
- Research area: Human-Computer Interaction, Input and Interaction Techniques, Information Visualization
- Website: <https://cmps-people.ok.ubc.ca/mkhasan/>
- Email: khalad.hasan@ubc.ca
- Office hours: Tuesday 12:30 pm to 1:30 p.m. (SCI 260)
- Always include DATA 541 in subject

Teaching Assistant

TA:

- A. K. M. Amanat Ullah
 - PhD Study, Computer Science

Course Objectives

The overall goal of this course is for you to:

Acquire the fundamental concepts of scripting and reporting for data analysis

Grading

Labs: 45%

Quizzes: 55%

In-Class Activities/Clickers: 0%

The Lab Assignments

Weekly lab assignments are worth **45%** of your overall grade.

Lab assignments may take more than the two hours lab time.

- No late labs will be accepted.
- A lab may be handed in any time before the due date and may be marked immediately by the TA in the lab.

Lab assignments are done individually.

The lab assignments are critical to learning the material and are designed both to prepare you for the exams and build up your skills!

The Quizzes

Two quizzes: 55% of total marks

- Quiz 1: 2023-09-21 (9:30 a.m.)
- Quiz 2: 2023-10-05 (9:30 a.m.)

Open-book exam

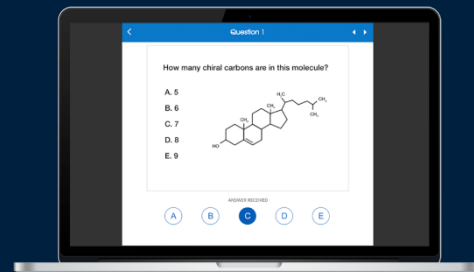

- You can use
 - Lecture materials (slides/pdf files)
 - Reading materials from GitHub
 - Programming code that you wrote as a part of lab / in-class activities / for your own practice
 - Written notes (e.g., pdf files or in a paper)

In-Class Activities / Clicker Quizzes

There will be ~40 in-class multiple-choice questions in all lectures.
Each question is worth 0 mark.

You need:

- iClicker Student Account
 - <https://www.iclicker.com/students/apps-and-remotes/web>
- Click on + to add a course, type institution name and type “Scripting and Reporting”
- At different times during all the lectures, questions reviewing material will be asked.

Programming Background Question

Question: How many of the following programming/scripting languages do you know?

- 1) Python
- 2) Java
- 3) C++
- 4) PHP

A) 0 **B)** 1 **C)** 2 **D)** 3 **E)** 4

Academic Dishonesty

Cheating is strictly prohibited and is taken very seriously by UBC.

A guideline to what constitutes cheating:

- Labs
 - Submitting code produced by others.
 - Working in groups to solve questions and/or comparing answers to questions once they have been solved (except for group assignments).
 - Discussing HOW to solve a particular question instead of WHAT the question involves.
- Exams
 - Only materials permitted by instructor should be in the exam.

Academic dishonesty may result in a "F" for the course and removal from the MDS program.

How to Excel in This Course

Be here!! Pay attention!!

This course is more about **skills** than knowledge

Memorizing a bunch of facts, or reading course materials before the quizzes, is not good enough.

Practice, practice, practice!

“What I hear, I forget. What I see, I remember. What I do, I understand.”

Systems and Tools

Course material is on [GitHub](#).

Marks are distributed on [Canvas](#).

Your laptop will be used to install all software and run programs.

To-Do

Windows OS:

- Command Prompt
- Ubuntu for Windows
 - <https://ubuntu.com/tutorials/install-ubuntu-on-wsl2-on-windows-10#1-overview>
- Cygwin
 - <https://www.cygwin.com>
- MobaXterm
 - <https://mobaxterm.mobatek.net/>
- Windows Powershell - Windows 10 Application

Mac OS:

- Terminal (Mac command line interface)

A Brief History

Command Line Interface

Interaction style

- User issues a command, waits for response
- Feedback can be given during execution
- Commands need to be learned

Users

- trained experts

```
khalad@A4005069:/mnt/c$ cd Courses/DATA\ 541/
khalad@A4005069:/mnt/c/Courses/DATA 541$ ls
Lab2      example1.txt  lab1         'lecture 2'
a.txt     example2.txt  'lecture 1'  'lecture 3'
```

What is the Command Line?

The **command line** is the text interface to the computer that accepts commands that the computer will execute. These commands include:

- starting programs
- navigating directories and manipulating files
- searching, sorting, and editing text files
- system and environment configuration

The command line is part of the **operating system**, which is software that manages your computer including all devices and programs.

- Common operating systems include Windows, Mac OS, and Linux/Unix.

Why learn the Command Line?

The **command line** is the text interface to the computer.

Understanding the command line allows you to interact with the computer in ways that you often cannot with the user interface

- Example: Configuring Windows Server Core

It's easier to set up and run program

- Git was designed exclusively for the command line

It's easier to perform network troubleshooting

- Example: ping, traceroute

Why learn the Command Line?

The command line is commonly used for scripting and automation of tasks

- Example: Shell Scripts

People commonly use commands to manage files on a file server or web server and when accessing remote systems.

- Example: SSH

When people become experienced with commands, they are faster accessing information with commands than both menus and ribbons

- Example: `ipconfig`

Windows Command Line

The command line on Windows dates back to the original Microsoft operating system called **DOS (Disk Operating System)** in 1981.

This command line interface is still part of all modern Windows operating systems and is accessible as the "Command Prompt".

It is commonly used for system administration and scripting.

Command Line - Windows

Start menu → Windows System → Command Prompt.

```
Administrator: Command Prompt

C:\>cd "Courses\DATA 541"

C:\Courses\DATA 541>dir
Volume in drive C has no label.
Volume Serial Number is 9043-9BD2

Directory of C:\Courses\DATA 541

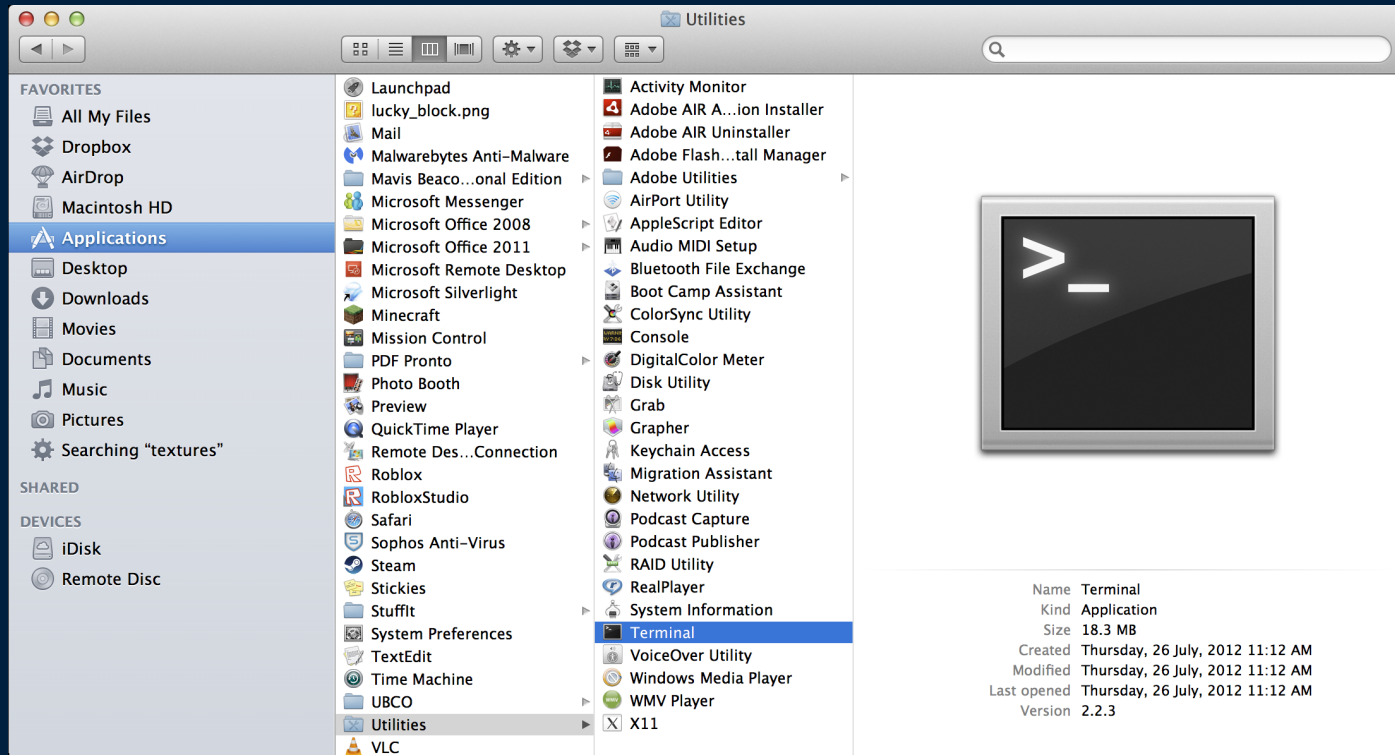

2018-08-28  05:31 PM    <DIR>          .
2018-08-28  05:31 PM    <DIR>          ..
2018-08-28  05:30 PM    <DIR>          lecture 1
2018-08-28  05:30 PM    <DIR>          lecture 2
2018-08-28  05:30 PM    <DIR>          lecture 3
2018-08-28  05:30 PM    <DIR>          lecture 4
2018-08-28  05:30 PM    <DIR>          lecture 5
2018-08-28  05:30 PM    <DIR>          lecture 6
2018-08-28  05:30 PM    <DIR>          lecture 7
2018-08-28  05:30 PM    <DIR>          lecture 8
2018-08-28  05:27 PM                3 readme.txt
2018-08-28  05:28 PM                0 syllabus.docx
                        2 File(s)              3 bytes
                        10 Dir(s)  27,475,976,192 bytes free

C:\Courses\DATA 541>notepad readme.txt

C:\Courses\DATA 541>
```

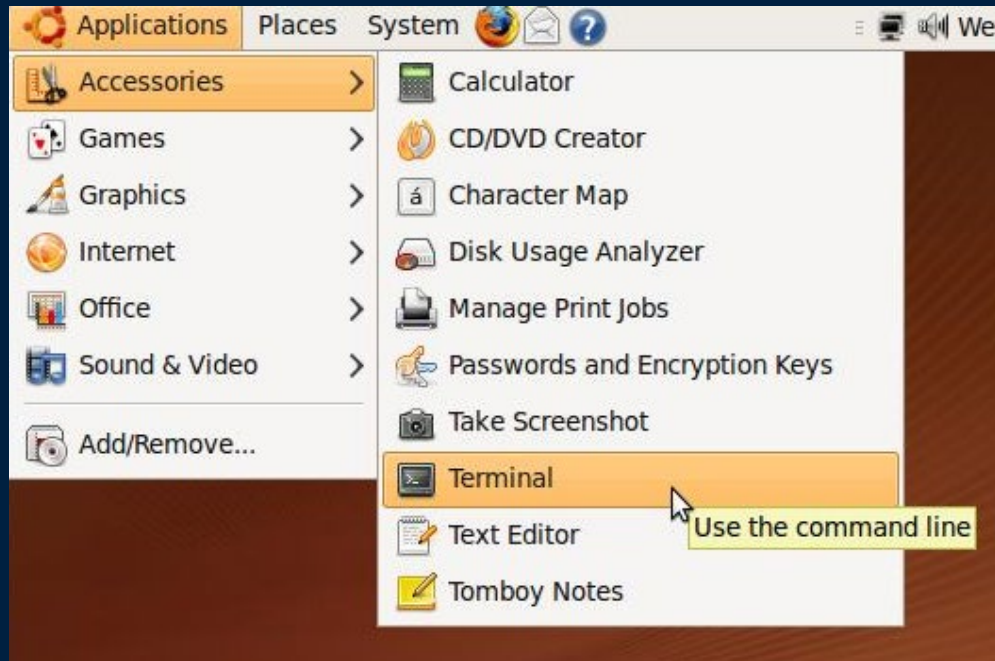

Mac OS Command Line

Applications → Utilities → Terminal.

Command Line –Linux/Ubuntu

Applications → Accessories → Terminal

Entering a Command

Enter a **command** at a **prompt**.

- The prompt may be a > or a \$ or a # or customized by the user.
- Windows (DOS): C:\>
- OS X (bash shell): My-iMac:/ me\$
- Linux (bash shell): [root@myserver /]#

```
khalad@A4005069: /mnt/c/Courses/DATA 541
khalad@A4005069:~$ cd /mnt/c
khalad@A4005069:/mnt/c$ cd Courses/DATA\ 541/
khalad@A4005069:/mnt/c/Courses/DATA 541$ ls
Lab2      example1.txt  Lab1      'lecture 2'
a.txt     example2.txt  'lecture 1' 'lecture 3'
khalad@A4005069:/mnt/c/Courses/DATA 541$
```

Press ENTER to execute the command.

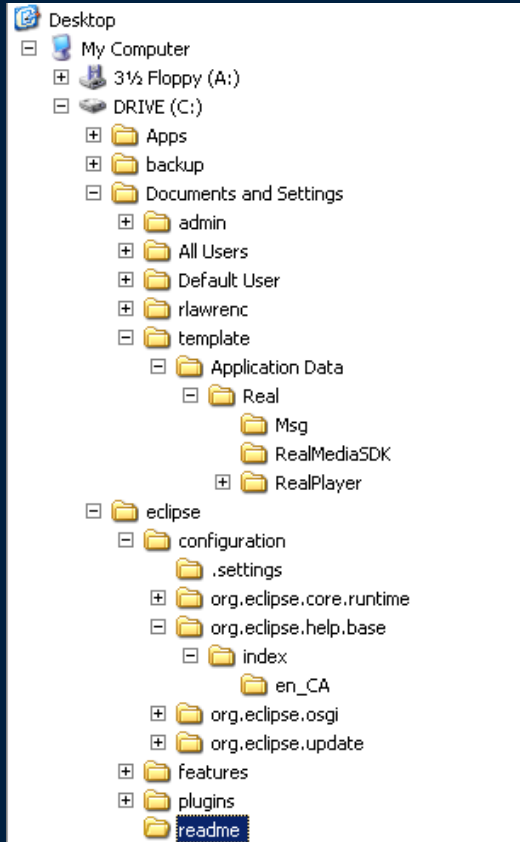

On Windows, commands are mostly case-insensitive while on Mac/Linux they are case-sensitive.

```
C:\Courses\DATA 541>mkdir Lab2

C:\Courses\DATA 541>cd lab2

C:\Courses\DATA 541\Lab2>
```

File System

The **file system** organizes data on a device as a hierarchy of directories and files.

Each **folder** (directory) has a name and can contain any number of files or subdirectories.

Each **file** has a name.

The user can change (navigate) directories in the hierarchy.

The Directory Structure: Linux

The file system is arranged in a hierarchical structure

The top of the hierarchy is traditionally called root
written as a slash '/'

Absolute versus Relative Paths

The **root** of the file system is the directory `" / "`.

- There is only one root of a directory hierarchy.

A path to a new location (from your current location) can be specified as an **absolute path** from the root:

```
cd /users/khalad/Courses/DATA541
```

or a **relative path** from your current location:

```
cd Courses/DATA541
```

To back up one directory level, use the command: `cd ..`

File, Absolute and Relative Paths Question

Question: How many of the following statements are **TRUE**?

- 1) In Windows OS, “C:\Files\Programs\someFile.txt” is an example of relative path
- 2) A directories can contain any number of subdirectories
- 3) Absolute path to `host` is `/usr/bin/host`
- 4) A relative path from `usr` to `file.txt` is different than a relative path from `bin` to `file.txt`

- A) 0 B) 1 C) 2 D) 3 E) 4**

Commonly Used File Navigation Commands

	Windows	Mac OS and Linux
List contents of directory	<code>dir</code>	<code>ls</code>
Change directory	<code>cd 541</code>	<code>cd 541</code>
Print working directory	<code>cd</code>	<code>pwd</code>
Make a directory	<code>mkdir 541</code>	<code>mkdir 541</code>
Remove a directory	<code>rmdir 541</code>	<code>rmdir 541</code>
Rename a file	<code>ren old.txt new.txt</code>	<code>mv old.txt new.txt</code>
Remove a file	<code>del file.txt</code>	<code>rm file.txt</code>
Copy a file	<code>copy src.txt dest.txt</code>	<code>cp src.txt dest.txt</code>

Commonly Used Text Related Commands

	Windows	Mac OS and Linux
Open a text editor	notepad	nano
Echo output	echo <i>Hello</i>	echo <i>Hello</i>
Output contents of a file	more <i>file.txt</i>	cat <i>file.txt</i>
Search text files	find	grep
Sort text files	sort	sort

Wildcards

A **wildcard** character allows for matching file names with more flexibility.

The **?** represents any **one** character in a file name.

Example: `file?.txt` would match `file1.txt`.

The ***** (asterisk) matches any number of characters (including zero).

Example: `*.txt` would match anything ending with `.txt` (`a.txt`).

Navigating the Command Line

	Windows Key	Mac OS Key
Previous command in history	Up	Up
Next command in history	Down	Down
First command in history	PageUp	
Last command in history	PageDown	
Move to start of line	Home	Ctrl+A
Move to end of line	End	Ctrl+E
Auto-complete file name	Tab	Tab

Pausing or Cancelling Commands

To **pause** a command:

- Windows: Press `Ctrl+S` or the `Pause` key. To resume, press any key.
- Mac: `Control+Esc` or `Command+.`

To **cancel** a command, press `Ctrl+C` or `Ctrl+Break`.

- The command is canceled, and the command prompt returns.
- However, any actions performed before the cancel are not undone.

Command Arguments

A command can take **arguments** that changes its behavior.

- Example: Path was an argument for the `cd` command. e.g. `cd 541`

On Windows, commands also can be modified by a **switch** (or extension) which is usually a slash then a letter (e.g. `/S`).

- To find out what is available, run the command with: `/?`

```
C:\Users\mkhasan>rmdir /?
Removes (deletes) a directory.
```

```
RMDIR [/S] [/Q] [drive:]path
RD [/S] [/Q] [drive:]path
```

```
    /S      Removes all directories and files in the specified directory
           in addition to the directory itself. Used to remove a directory
           tree.
```

```
    /Q      Quiet mode, do not ask if ok to remove a directory tree with /S
```

Command Arguments – Mac/Linux

On Mac/Linux, arguments are separated by spaces and begin with `-`.

An explanation of arguments can be found by using **man** then the command name. Example: `man cp` OR `copy /?`

```

khaled@A405056b: ~
CP(1)                                     User Commands                               CP(1)

NAME
    cp - copy files and directories

SYNOPSIS
    cp [OPTION]... [-T] SOURCE DEST
    cp [OPTION]... SOURCE... DIRECTORY
    cp [OPTION]... -t DIRECTORY SOURCE...

DESCRIPTION
    Copy SOURCE to DEST, or multiple SOURCE(s) to DIRECTORY.

    Mandatory arguments to long options are mandatory for short options too.

    -a, --archive
        same as -dR --preserve=all

    --attributes-only
        don't copy the file data, just the attributes

    --backup[=CONTROL]
        make a backup of each existing destination file

    -b
        like --backup but does not accept an argument

    --copy-contents
        copy contents of special files when recursive

Manual page cp(1) line 1 (press h for help or q to quit)

```

Command Arguments – Mac/Linux

Once you have a command prompt open, type ping /? and press Enter. On Windows 10, you should see something like this.

```

C:\Windows\system32\cmd.exe

C:\>ping /?

Usage: ping [-t] [-a] [-n count] [-l size] [-f] [-i TTL] [-v TOS]
          [-r count] [-s count] [[-j host-list] | [-k host-list]]
          [-w timeout] [-R] [-S srcaddr] [-c compartment] [-p]
          [-4] [-6] target_name

Options:
    -t             Ping the specified host until stopped.
                   To see statistics and continue - type Control-Break;
                   To stop - type Control-C.
    -a             Resolve addresses to hostnames.
    -n count       Number of echo requests to send.
    -l size        Send buffer size.
    -f            Set Don't Fragment flag in packet (IPv4-only).
    -i TTL         Time To Live.
    -v TOS         Type Of Service (IPv4-only. This setting has been deprecated
                   and has no effect on the type of service field in the IP
                   Header).
    -r count       Record route for count hops (IPv4-only).
    -s count       Timestamp for count hops (IPv4-only).
    -j host-list   Loose source route along host-list (IPv4-only).
    -k host-list   Strict source route along host-list (IPv4-only).
    -w timeout     Timeout in milliseconds to wait for each reply.
    -R            Use routing header to test reverse route also (IPv6-only).
                   Per RFC 5095 the use of this routing header has been
                   deprecated. Some systems may drop echo requests if
                   this header is used.
    -S srcaddr     Source address to use.
    -c compartment Routing compartment identifier.
    -p            Ping a Hyper-V Network Virtualization provider address.
    -4            Force using IPv4.
    -6            Force using IPv6.
  
```

Command Shortcuts Question

Question: How many of the following statements are **TRUE**?

- 1) To cancel a command, press `Ctrl+X`.
- 2) To go to the next command in the history, press `Up` arrow.
- 3) This wildcard expression `te*a?.txt` matches `tea12.txt`.
- 4) The command to change a directory is `pwd`.

A) 0 **B)** 1 **C)** 2 **D)** 3 **E)** 4

Standard Input, Output, and Error

Standard input (`stdin`) is the default input device (usually a keyboard) into the terminal.

Standard output (`stdout`) is the location where output is sent after a command is run. The default is the terminal window.

Standard error (`stderr`) is the location where error messages are displayed (typically the terminal window).

Redirecting input and output

Standard output and **Standard error** are printed to terminal

We can redirect that output to a file using the '**>**' operator. This operator would

```
echo "hello" > output.txt
```

Creates or replaces contents

```
echo "hello again" >> output.txt
```

Append contents

The '**<**' operator is used for **input** redirection

```
more<output.txt
```

Escape Symbol

An **escape symbol** is used when a command requires input that contains a character with a special meaning. The escape symbol indicates this character is data not part of the command.

- On Windows, the caret (^) indicates that whatever character that follows it is data rather than part of the command. Example:

```
echo CS ^& DATA
```

```
C:\>echo CS & DATA
CS
```

```
'DATA' is not recognized as an internal or external command,
operable program or batch file.
```

- On Linux, use the backslash (\).

This is especially common when dealing with spaces in a file name. The other way to handle file names with spaces is to enclose them in double quotes:

```
copy test.txt "c:\program files\file spaces.txt"
```

Batch Files

A **batch program** (also commonly called a *batch file* or *command file*) is a text file that contains a sequence of commands to be executed.

You define the sequence of commands, name the sequence, and then execute the commands by entering the name at a command prompt.

Any action you can take by typing a command at a command prompt can be encapsulated in a batch program.

In Windows files typically end in `.bat` or `.cmd`

Creating a Batch File

Open the **Notepad** application. Write the application name that you would like to open. For our example, we would like to open the UBCO website with Internet Explorer and Google website with Chrome.

```
@echo off  
start microsoft-edge:http://ok.ubc.ca/  
start chrome https://www.google.ca/
```

After everything above is done, we now need to save the Notepad file. with .bat at the end. Bat file can be executed from Command Line or directly double-clicking on the file.

Try it: Navigating Directories with Commands

Question: Using a terminal window on your computer, perform the following actions:

- 1) Create a directory called 541.
- 2) Navigate into the directory 541.
- 3) Create a text file called `readme.txt` with a multi-line message in it
- 4) Display the content of the file in the command line
- 5) Display the content of the file sorted in alphabetical order
- 6) Find a substring from the file
- 7) List the contents of your directory.
- 8) Rename the file `readme.txt` to `message.txt`. Verify the name change.
- 9) Delete the `message.txt` file.
- 10) Change directory to directory above 541.
- 11) Delete directory 541.

Conclusion

The **command line** is the text interface to the computer that accepts commands that the computer will execute including running programs, manipulating files, and running scripts.

The command line allows for automation and more control than may be available in the user interface. It may also be the only way to interact with the machine if connecting via SSH.

The command environment allows for redirecting the standard input and output using input/output redirection.

Objectives

- Define command line and list some of its uses
- Explain the purpose of an operating system
- Know how to open the command line window on Mac OS and Windows
- Be able to enter commands and stop them
- Define: file system, folder, file
- Explain the difference between an absolute and relative path
- Use command line shortcuts to save time
- Know how to use command arguments
- Be able to write simple batch files

THE UNIVERSITY OF BRITISH COLUMBIA
